

GRECCO - SCREENER

APPLICATION AND OPERATION:

Bulk materials with content of fines which in conventional screen decks cause clogging due to adhesion of dust particles can be screened without any maintenance by means of the JÖST® Grecco – screener.

Round rods with different weights glued on their one side into transversal beams, this initiating transversal vibrations. This allows the gaps between these rods to have the typical self-cleaning action.

Special measures at the end of the rods prevent from inadmissible amplitudes. The machine can be built as circular or linear motion screen, this giving an even wider range of application. The system has been well-proven with 30.000 tons of Run-of-Mine-product.

Recommended Applications:

- Limestone screening at 12 mm
- Gypsum screening at 4 up to 10 mm
- Coal screening at 6 up to 15 mm
- Ore screening
- Magnesite screening at 4 mm
- Cullet screening at 12 mm
- Waste recycling

YOUR BENEFIT:

- Efficient classifying with difficult humid product
- High throughput possible
- No clogging
- No special maintenance required
- Low-noise machine
